

Purified Dermatan / Chondroitin B Sulfate Chains From Human Recombinant Endocan / ESM-1

Essential Notes

Cat. Number: LIDS-1001-50U

Size: 50 µg / 100 µl

Formulation: solution in PBS

Storage: -20°C

Applications: Bioassays,
Standard for quantification,
Molecular interactions

Description

Endocan also called endothelial cell specific molecule 1 (ESM-1) is a proteoglycan of 50 kDa carrying a unique chain of glycosaminoglycan of chondroitin B / dermatan sulfate type (Bechard et al. 2001; Sarrazin et al. 2010). Endocan / ESM-1 binds through its DS / CS chain to pro-angiogenic molecules such as HGF/SF and regulated their activity. This CS / DS proteoglycan is a biomarker of endothelial dysfunction in cancer and sepsis.

Source

Dermatan sulfate chains from purified human recombinant endocan / ESM-1 were released from the core protein by β -elimination, purified by successive ion-exchange and gel filtration chromatographies as described in Sarrazin et al. 2010a.

Quantity

50 µg per vial.

Formulation

In a solution in phosphate buffer saline (PBS) pH7.4.
The DS specific, IdoA-containing disaccharides contribute 30% of the chain (15% of which are 2-O-sulfated) and are mostly clustered in tetra- (35%), hexa- (12%), and octa- (5%) saccharide domains.

Storage

We recommend that all products should be stored at -20°C upon receipt.

If made up into solutions, avoid repeated freeze-thaw cycles. Stock solutions should be prepared in appropriate aliquots and stored frozen.

Applications

- Bioassays
- Molecular interactions

Optimal dilutions should be determined for each application by end-user.

■ BACKGROUND

Endocan, also known as endothelial cell-specific molecule (ESM-1), was originally discovered in endothelial cells from the lungs by Lassalle and collaborators (Lassalle et al. 1996). Structurally, endocan is a dermatan sulfate proteoglycan of 50 kDa that is freely circulating in blood (Bechard et al. 2001a; Sarrazin et al. 2010a). Endocan / ESM-1 binds CD11a/CD18 integrin (also called LFA-1 for Leukocyte Function-associated Antigen-1) on human leukocytes inhibiting consequently its binding to ICAM-1 and transendothelial migration (Bechard et al. 2001b; De Freitas Caires et al. 2009). Moreover, endocan / ESM-1 has been recently described as a biomarker of tip cells (Sarrazin et al. 2010b). The expression of endocan / ESM-1 is upregulated by pro-inflammatory molecules such as tumor necrosis factor alpha (TNF α), and pro-angiogenic molecules such as vascular endothelial growth factor (VEGF) and fibroblast growth factor 2 (FGF-2) (Grigoriu et al. 2006; Sarrazin et al. 2006; Maurage et al. 2009). Endocan / ESM-1 binds via its dermatan sulfate chain to hepatocyte growth factor/scatter factor (HGF/SF) (Bechard et al. 2001a; Sarrazin et al. 2010b). Elevated blood levels of endocan / ESM-1 has been reported in patients with lung and kidney cancers as well as in patients with severe sepsis (Bechard et al. 2001b; Scherpereel et al. 2003; Grigoriu et al. 2006; Scherpereel et al. 2006; Sarrazin et al. 2010b; Leroy et al. 2010).
